

# Pesticide Exposure and Child Health: New Evidence and Putting it into Practice

---

Catherine Karr MD PhD  
Professor  
Pediatrics/Environmental &  
Occupational Health Sciences  
Director, NW Pediatric  
Environmental Health Specialty  
Unit  
University of Washington

Cynthia Curl MS PHD  
Associate Professor  
Department of Community  
& Environmental Health  
Director, Agricultural  
Health Lab  
Boise State University

# Disclosures

---

- Dr. Karr and Dr. Curl have no disclosures to report

# Outline

---

An introduction to a complex topic

How are children exposed?

Health Impacts

- Acute and chronic toxicity
- Emerging issues
  - Neonics - newer class of insecticides
  - Glyphosate – research in progress
  - COVID killers

Advising your patients

This is why we should protect our kids. We need to get rid of any pesticides that we could bring home from the fields. Here are some tips.

Wipe your shoes before coming in the house.

Leave the shoes in a special spot near the door.

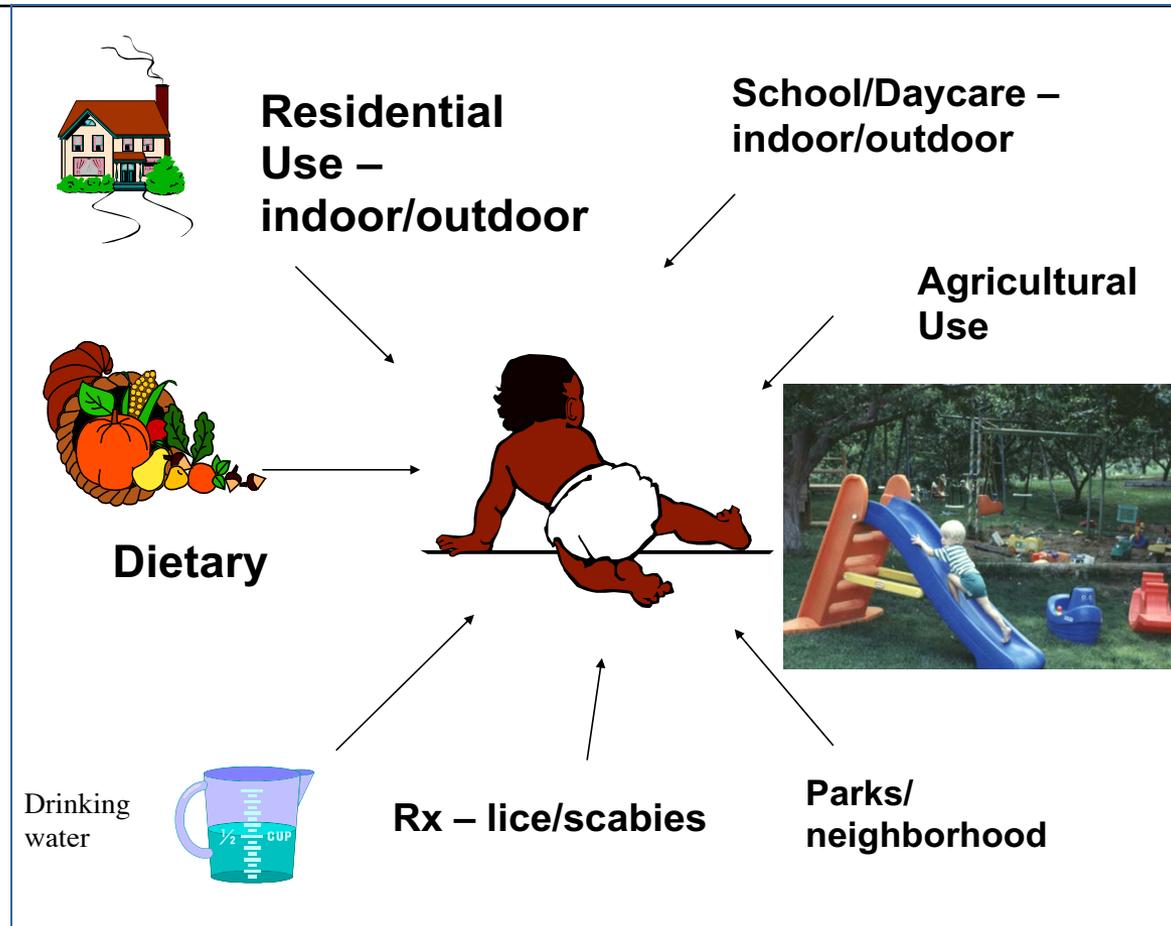

Take a shower.

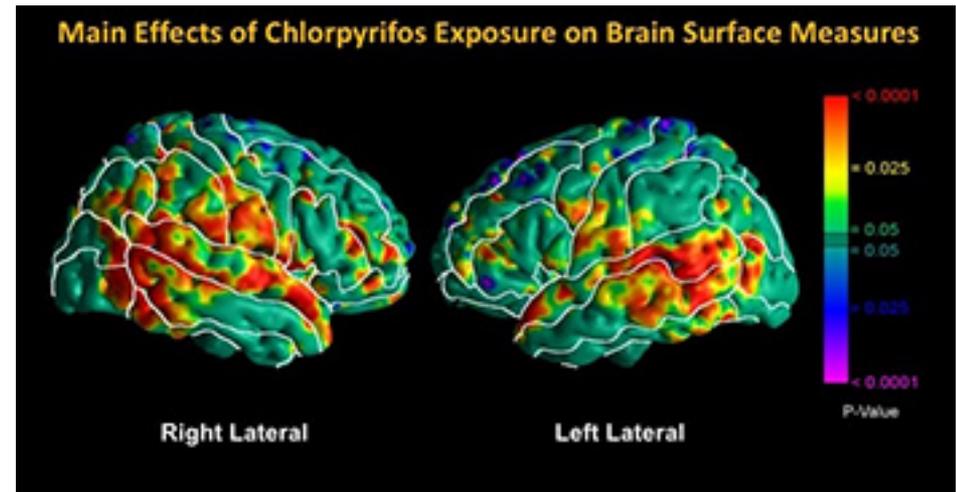

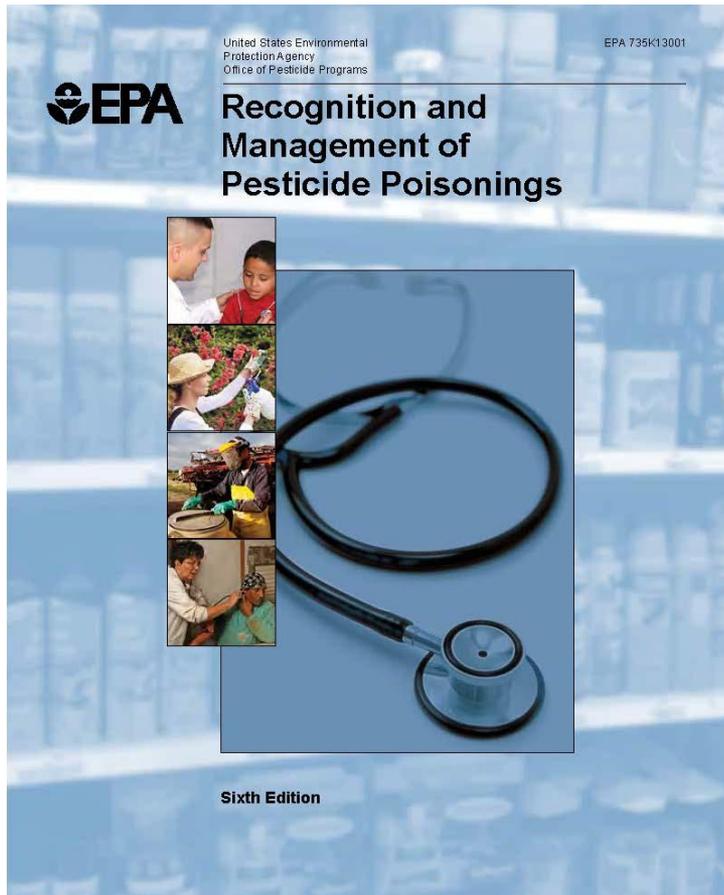

Wash your hands and our kids' hands.

# Multiple sources of exposure

# Pediatric Health Implications

[www.niehs.nih.gov/research/supported/success/2016/rauh/index.cfm](http://www.niehs.nih.gov/research/supported/success/2016/rauh/index.cfm)

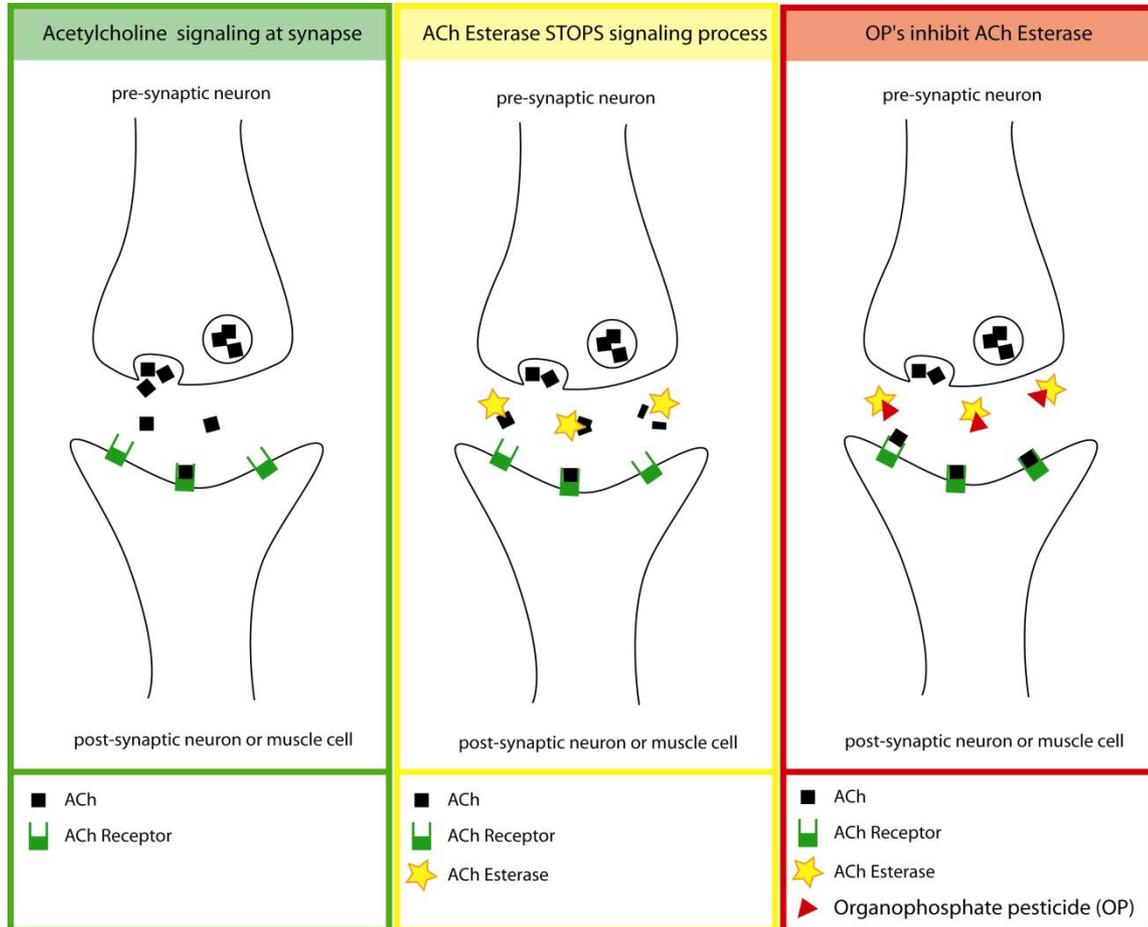

# Organophosphate/N Methyl Carbamate Insecticides

---

- ❑ **Important in acute poisoning reports**
- ❑ Widely used in agriculture, some home garden products
- ❑ Variable acute toxicity but many = high (class I and II)
- ❑ Well absorbed via inhalation, dermal, ingestion
  
- ❑ Malathion, Chlorpyrifos (Dursban), Phosmet, Carbaryl (Sevin), Methyl parathion (Pesticide label lists active ingredient)

# OP/Carbamates Acute Neurotoxicity : Cholinesterase Inhibition

Nausea, vomiting, diarrhea  
Weakness, twitching, paralysis  
Visual blurriness (meiosis),  
Confusion, lightheadedness, coma

Hypersecretion:  
Tearing  
Bronchial secretions, wheezing, edema  
Sweating, salivation, urination

# Signs and Symptoms in a CHILD

---

**More likely to have hypotonia & mental status changes such as lethargy and coma, seizures**

eg. seizure occurrence based on case series:

- adults 2-3%
- children 22-25%

Classic cholinergic excess signs of hypersecretion are less likely to occur, particularly at initial presentation

**Often mistaken for viral illness (respiratory infection, gastroenteritis, meningitis)**

Case series found 80% of children with organophosphate poisoning were transferred with the wrong diagnosis

# Pyrethroid Insecticides

---

Also neurotoxic but.... *Generally* less acutely toxic compared to OPs/ carbamates

Sites of action = Na & Cl channels; GABA, nicotinic acetylcholine, & peripheral benzodiazepine receptors = varied acute neurotoxicity

Generally low skin absorption (exposure via ingestion, inhalation)

- Type I – (permethrin)
- Type II (contain a cyano group) – cypermethrin, fenvalerate

**TYPE II are more commonly associated with poisonings**

# Pyrethroid signs/symptoms

---

- ❑ Nonspecific symptoms - headache, fatigue, vomiting, diarrhea, and irritability
- ❑ Reflex hyperexcitability, tremor, choreoathetosis
- ❑ Similarities to OPS-hypersecretion, muscle fasciculation, pulmonary symptoms and seizures

And for lower dose exposures, (without symptoms above)

- ❑ Paresthesias - Skin irritation and paresthesias (burn/tingle/numb), often face (most commonly reported for Type II group)

## Popular weed killer's alleged link to cancer stirs widespread concern

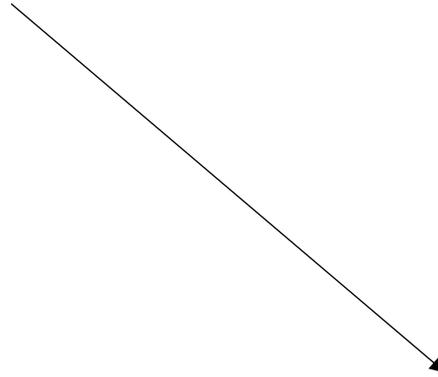

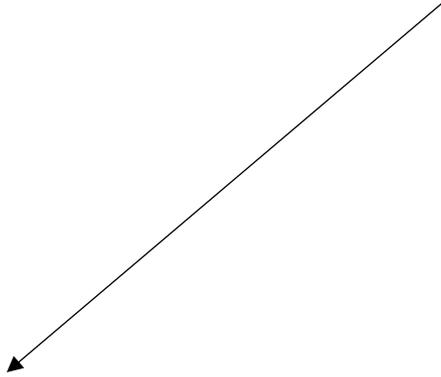

Two juries have implicated Roundup as the cause of cancer in frequent users, but major public health agencies disagree over whether it is a carcinogen.

Roundup products for sale at a store in San Rafael, California on July 9, 2018. Josh Edelson / AFP - Getty Images File

April 1, 2019

Cynthia Curl, an environmental health scientist at Boise State University in Idaho who studies the chemical, said, "many assumptions have been made about the safety of glyphosate that are now being actively questioned. We will see an explosion of information about glyphosate, and it's about time. We're really playing catch-up on this one."

**Conventional Group**

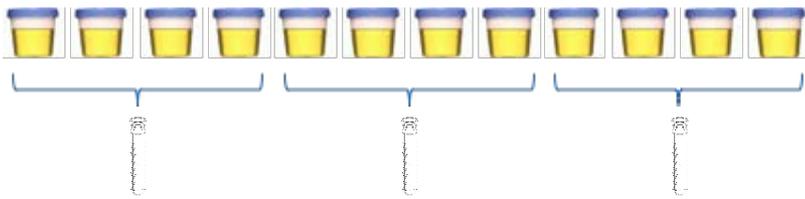

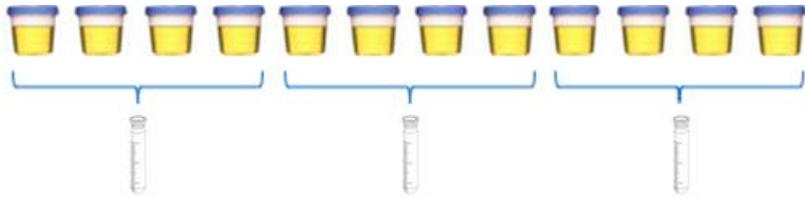

**Organic Group**

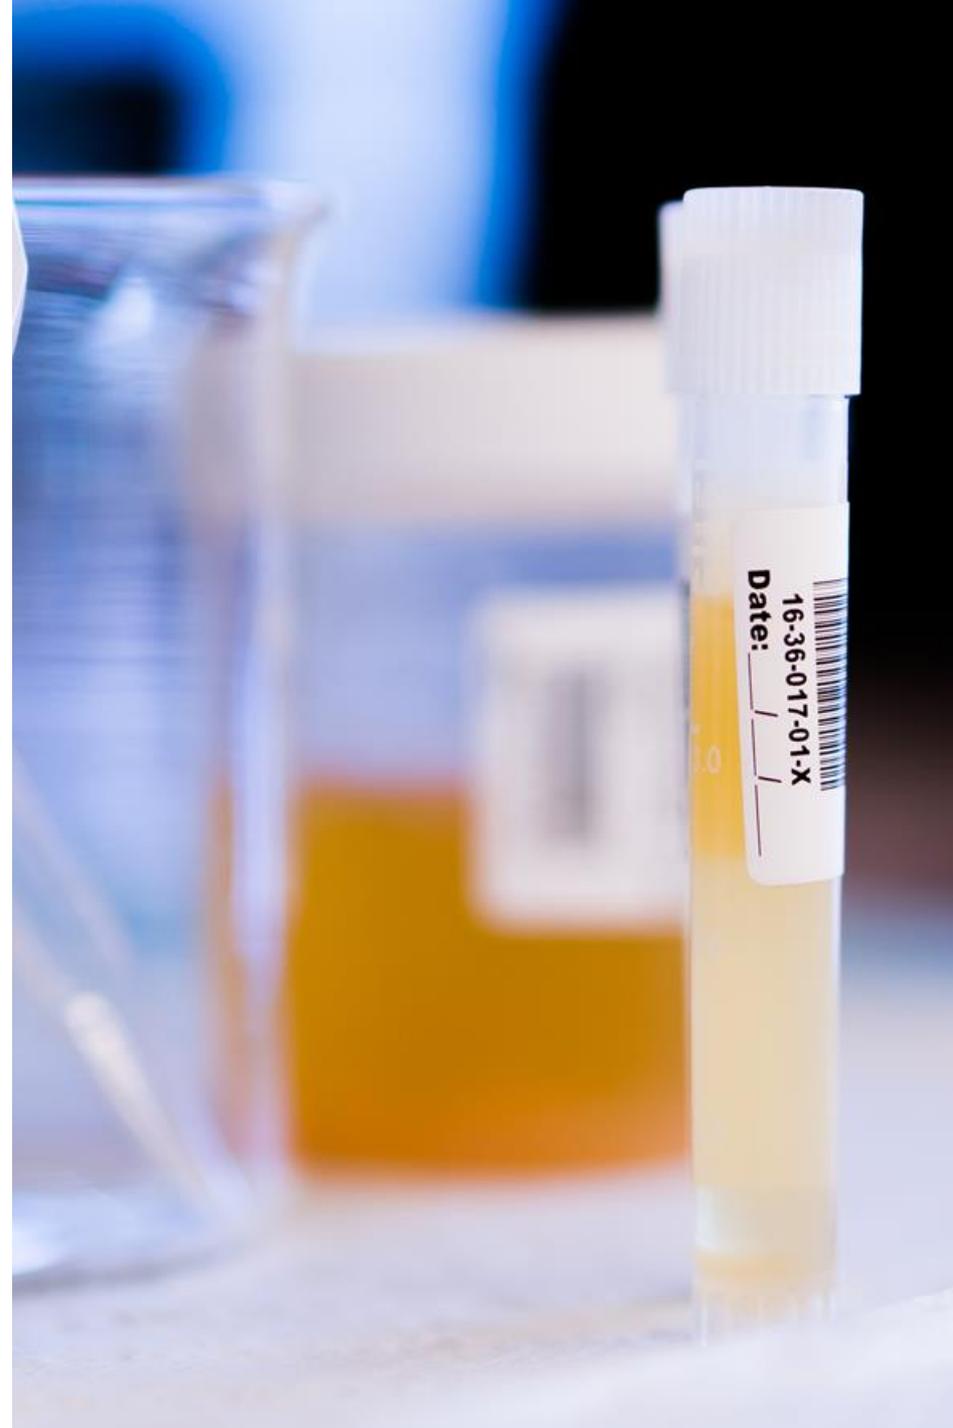

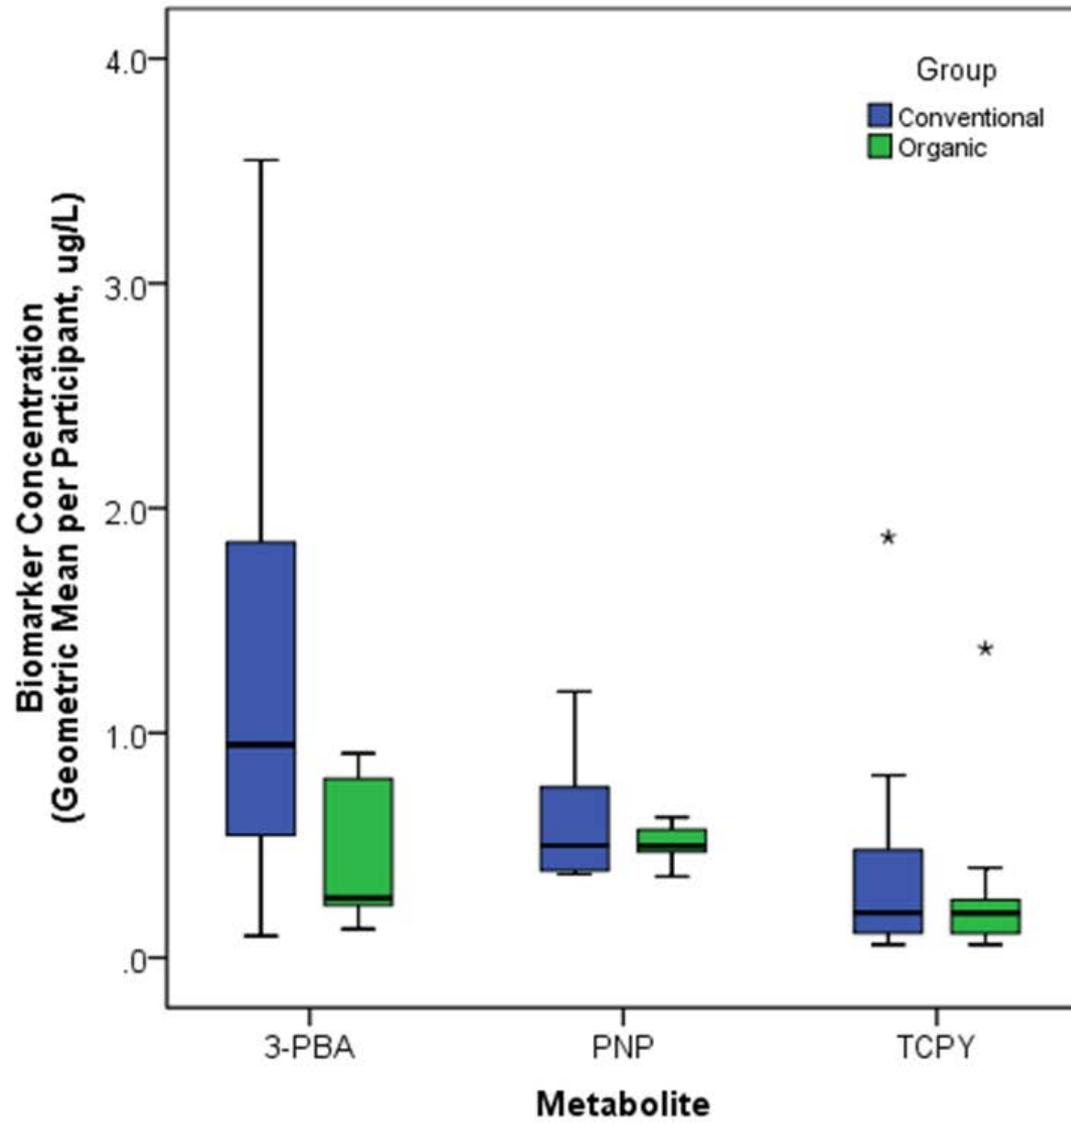

1 baseline  
sample

**24 weekly samples** composited in 1 mL aliquots to create six “monthly” aggregate samples representing the **second and third** trimesters

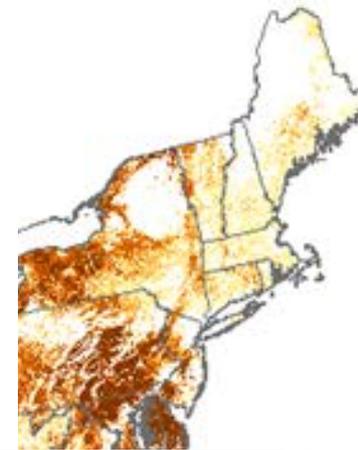

## Measurement of Agricultural and Dietary Glyphosate Exposure among Pregnant Women

- To gain a better understanding of pregnant women's exposure to glyphosate
- (If exposed) to understand how much of that exposure is coming from where they live and how much is coming from what they eat

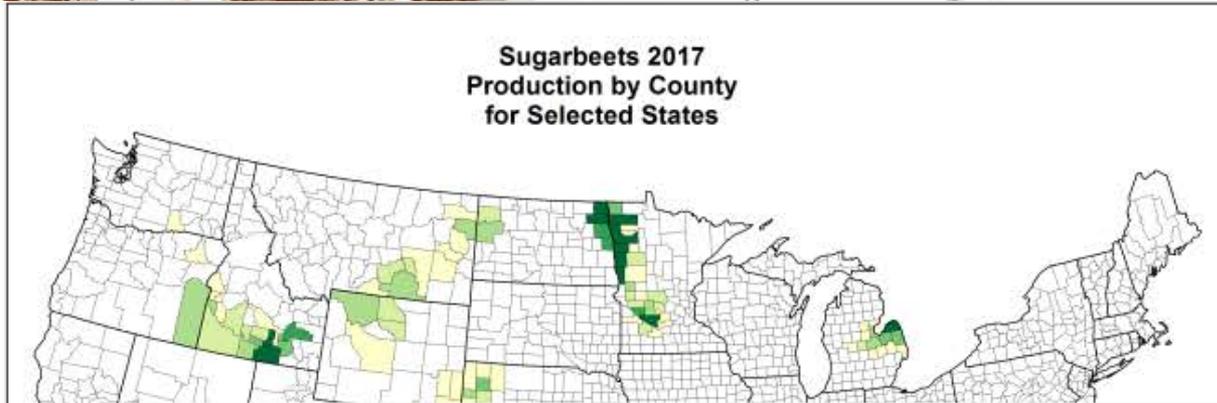

# Estimated Agricultural Use for Glyphosate , 2014 (Preliminary)

U.S. Department of

Participants will take part in a two-week organic and conventional dietary intervention study, in a cross-over design.

We will collect weekly urine samples throughout pregnancy, and daily urine samples during the dietary intervention, for a total of 36 samples per participant, and 1,440 samples in total.

40 pregnant women  
Recruited as part of this proposed project

20 living >10 miles from  
glyphosate-treated fields  
("urban" participants)

20 living <1 mile from a  
glyphosate-treated field  
("near field" participants)

10 "urban" assigned an  
**organic** diet

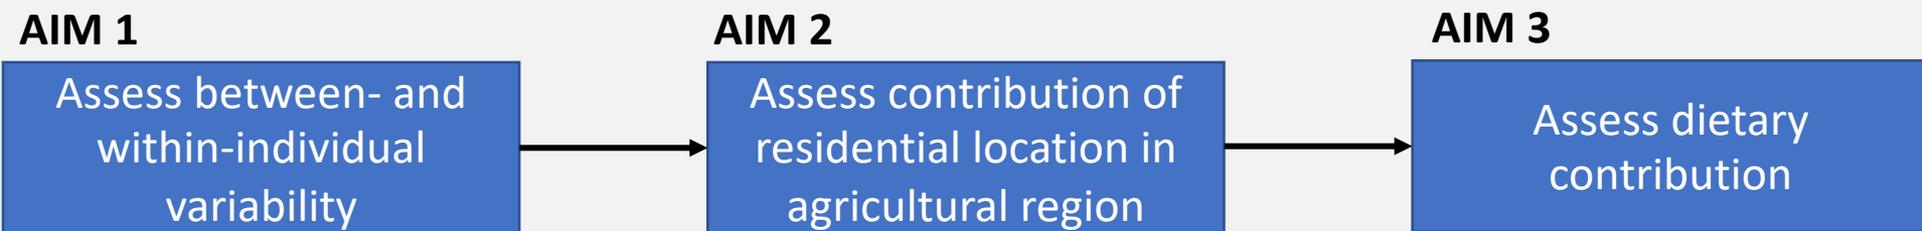

10 "urban" assigned a  
**conventional** diet

10 "near field" assigned an  
**organic** diet

10 "near field" assigned a  
**conventional** diet

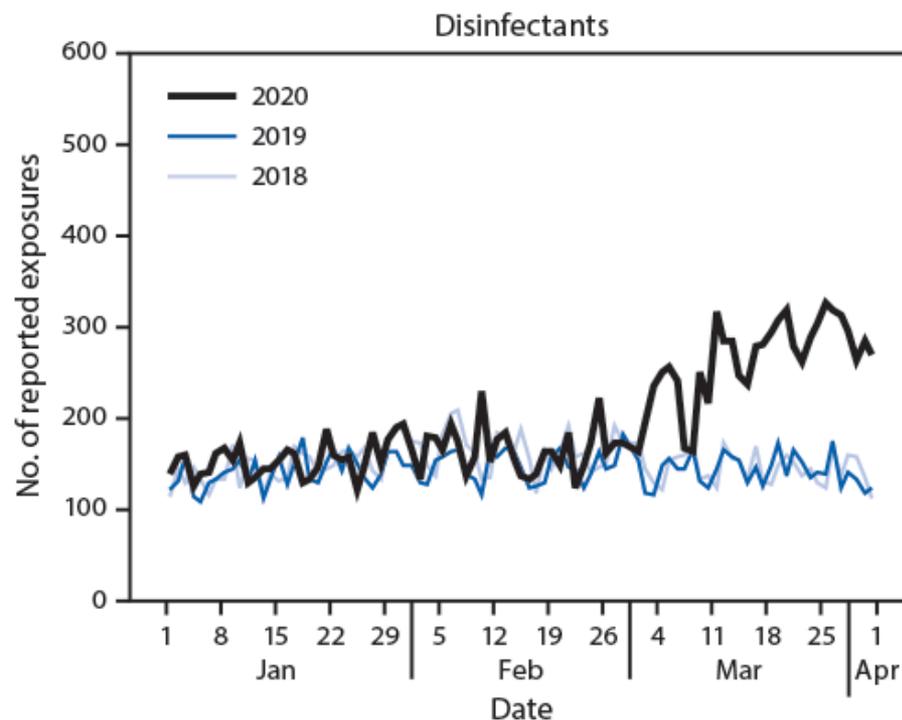

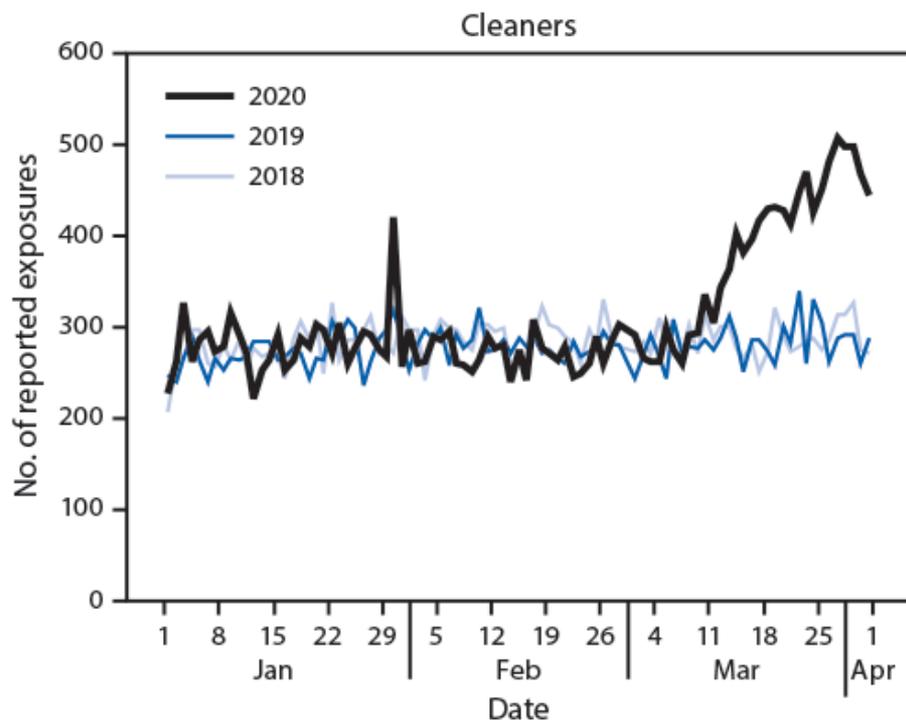

Despite its extensive use, frequent environmental presence and potential toxicity, very little biomonitoring data exists to characterize human exposure to glyphosate.

This project aims to assess glyphosate exposure among a cohort of pregnant women and to quantify the relative contribution of agricultural and dietary sources to this exposure.

# Antimicrobial Pesticides: COVID-19 Killers

Daily Exposures to Cleaners and Disinfectants  
Reported to US Poison Control Centers  
January-March 2018, 2019, 2020

# Educate Families on Appropriate Use

- Know when & which surfaces should be cleaned and/or disinfected
- Cleaning with soap & water is sufficient (in most cases) for households where no one is sick
- Sanitize or wash hands when returning home before touching anything
- Choose safer sanitizers/disinfectants – look for the seal – and know what to avoid

Bleach, Quaternary Ammonium Compounds = asthmagens

- Follow label directions – allow for proper dry time, never mix products/chemicals
- Store cleaners, sanitizers, disinfectants, & cleaning tools out of reach from kids
- Keep areas well-ventilated during use

Safer options are available

Look for Safer Choice, Green Seal®, Ecologo® and Design for the Environment (DfE) labels on products.

# Key Terms

## Cleaner

Removes germs, dirt, and impurities from surfaces or objects. Works by using soap/detergent, water and friction to physically remove dirt and germs from surfaces. Cleaning before disinfecting reduces spreading infection more than disinfecting alone.

## Sanitizer

Reduces germs on surfaces to levels considered safe for public health (usually 99.99%). Products must be EPA registered.

## Disinfectant

Destroys almost all infectious germs, when used as the label directs on a surface. No effect on dirt, soil, or dust. Should be used where required by law, in high-risk and high-touch areas, or in case of infectious disease. Products must be EPA registered.

## Safer Disinfectant Use During the COVID-19 Pandemic

Using disinfectants on surfaces in your home or workplace can kill disease causing germs (bacteria and viruses), **but they may also have health risks.** For example, many common disinfectants (like bleach, many disinfectant wipes) have chemicals in them that can cause or worsen asthma.

### If no one is sick at home:

**Clean surfaces in your house** with an all-purpose cleaner or soap, and a microfiber cloth (available online, in grocery stores and at big box stores). This will get rid of most of the germs on a surface and avoids excess exposure to disinfectants.

**Disinfect after cleaning** surfaces that you touch when returning from the outdoors, prior to washing hands.

### If someone in your house is sick or suspected to be sick:

**Clean surfaces, then disinfect** using one of the safer disinfectants from the EPA's Design for the Environment antimicrobial pesticide list.

#### Look for these safer active ingredients:

- ▶ Citric Acid
- ▶ Hydrogen Peroxide
- ▶ L-lactic acid
- ▶ Ethanol
- ▶ Isopropanol
- ▶ Peroxyacetic acid
- ▶ Sodium Bisulfate.

**Apply to the surface and leave glistening wet** for the time listed on the product label.

### If you can't access safer products

**If you don't have access to a microfiber cloth**, wash sponges or towels after every surface cleaned:

- ▶ **Clean sponges** by washing in the dishwasher, or soaking for one minute in 1/2 teaspoon of bleach, or microwaving **non-metallic**, soaking wet sponges for one minute.
- ▶ **Wash towels** in a basin or washing machine.

**If you only have access to bleach** or quaternary ammonia-based disinfectants:

- ▶ **Dilute disinfectants** per the package instructions;
- ▶ **Do not combine disinfectants;** and
- ▶ Be sure to **ventilate the area** as well as possible (open windows, turn on fans).

**Find out more, download our detailed safer disinfecting factsheet here.**

See disclaimer on detailed safer disinfecting factsheet.

www.pehsu.ucsf.edu

# Non acute exposure “cases”

---

I'm worried about the pesticides in my garden/home/job – how can I protect my child?

Is organic food worth it?

What do low everyday low doses mean for health?

# Encourage organic?

---

## Why?

- **Organic produce reduces pesticide exposure in children** and there is evidence of potential adverse health impacts in children with low dose exposure
- **Organic farming brings other environmental and occupational health benefits**

## Why not?

- Don't want to discourage **IMPORTANCE** of fruit/vegetable in diet
- Expense

See [Healthychildren.org](http://Healthychildren.org) "Is organic worth the price"? and "AAP weighs in for first time on organic foods for children"

# Advising patients

---

- Wash and scrub produce with water (cleansers not necessary), throw away the outer leaves of leafy vegetables, and trim the skin and fat from poultry, fish and meats.
- Purchase organic when possible, but not at the expense of a diet rich in a variety of fresh fruits and vegetables.

# Key Anticipatory Guidance

---

- ❑ Informed by Env Hx – occupational exposures in the household, young workers? Pesticide use/storage at home?
- ❑ Recommend wash hands and face and change out of contaminated clothes and shoes before returning home, entering car, and wash contaminated clothes separately from the rest of the laundry.
- ❑ Discuss safe storage
- ❑ Encourage use of low toxicity or non toxic pest control approaches for home/garden pest problems.
